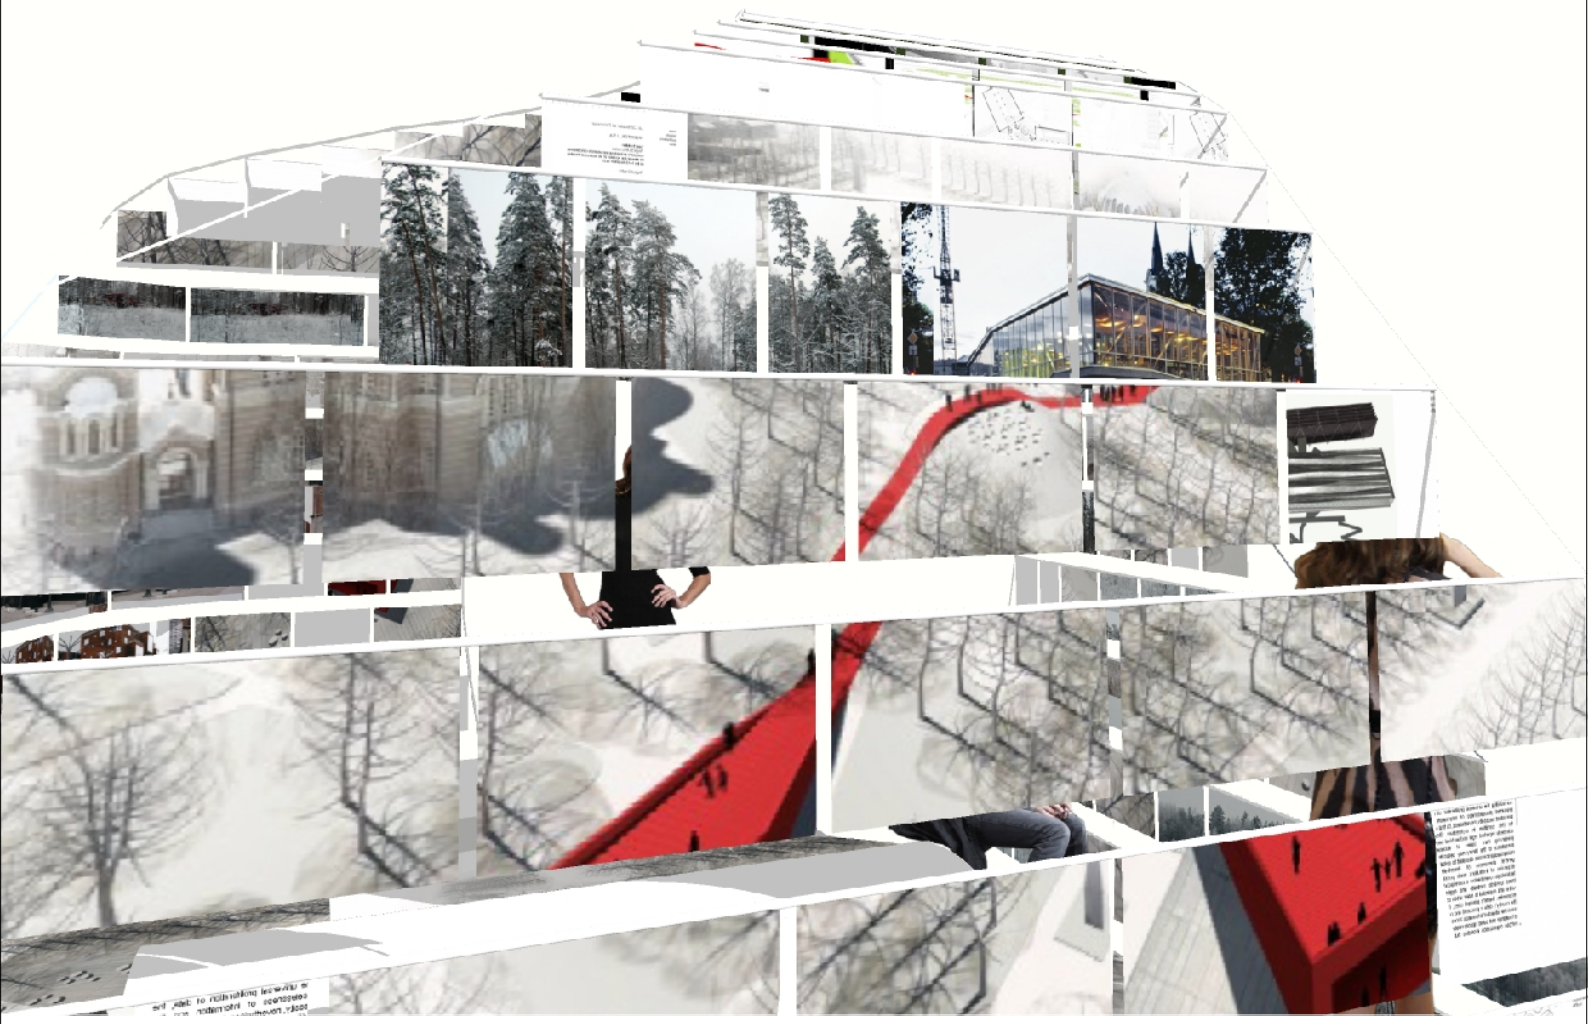
KEYWORD "WINDY"



SO TO SAY IDEAL BALTIC ARCHITECTURAL LANDSCAPE

The structure of the pavilion is made up of thin metal rods with a spacing of 300 ✣ 300–500 mm. The metal structure can be replaced with small paper pipes connected with metal pieces. Paper blocks are hung from the structure, with the open edges of the blocks facing downwards. Ventilators are placed in the corners of the room, directed at the papers.

The central character of the exposition is the house. A story about the house, why it is the way it is? It is important to introduce the factors that influence the house, such as the climate, financial factors, values, fashion and trends, energy conservation, the central role of cars and means of transport (public transport, cars, walking, cycling), various standards that the house has to meet, plan, function etc. Each factor is accompanied by an illustrative pictogram, forming a visual language consistent throughout the exposition. For example, the information leaflets demonstrate in percentages to what extent the architecture of the building has been influenced by some factor or other.

The structure and elements of the exposition can be dismantled into single pieces and are easy to transport. The cost can only be estimated after the technical execution has been specified, but it will remain within the given budget range.
