

In an area defined by warming Gulf stream, Scandinavian mountain spine and Slavic land plato, Baltic states lie in an air mass transit rendered area, where stream of weather is in a constant float. Furthermore, Baltic states reside in a mid-range North hemisphere what results in a very distinct and period-equal four seasons of Earth year cycle.

We come to understanding, how balanced cyclic seasonal shift influences local populations' architectonic understanding - massive, deep foundations to counteract freezing ground movement, rigid, firm construction of outer walls and concluding elegant timber ballet of roof construction, covered with clay tiles.

All is to gently getting through the year, all is to sustain life in a moving climate.
